Q4:100%	215	89.4	97.7	91	98	77.89	940000

Q2 = Median

Since median is the midpoint of the dataset, its values will be same as 50th percentile values (Q2).

Salary: 25% of the data belongs to 240k and 50% of the data is under 265k which is just 15k increase between 25 – 50%. Also, the 75% of data is in 300k which is 35k of increase and far better than Q2 – Q1 increment. Finally the 100% of the data is 940k and which is 640k increase compared to all quadrants. Since 99% of the data is unknown, cannot decide the increase between 100 – 99% gap.

SSC_P: It's 25% of the data is at nearly 60 and 50% of the data is 67 which is 7 marks increase between this boundary, and 75% of the data at 76 with 9 marks increase. There is a huge difference between 100% of the data and 75% of the data with 13 marks increase. Also, it's notable that there are 2 marks gap between 99 – 100%.

HSC_P: 25% of the marks around 61 and 50% of the marks are in 65 with just 4 marks increase. Then the 75% of the marks reached 73 with 8 marks increase. After the 100% marks fall in 97 with huge increase around 24 marks increase. Also, there is around 7 marks difference between 99 – 100%.

Degree_P: 25% of the degree marks fall under 61 and 50% of the degree marks belongs to 66, just 5 marks differ in Q2 – Q1 range. Then 75% of the degree marks reached to 72 also around 6 marks gap in Q3 – Q2 range, almost same as Q2 – Q1. After the 100% of the degree marks under 91 with 19 marks increase, which is too high than other quadrants. Finally, the 99 – 100% range also has remarkable difference about 8 marks in just 1% gap.
